

A gentle, solar breeze

If your home gets cold, musty and maybe a little mouldy in winter, a SolarVenti could be the answer.

It's a solar collector that heats, dries and ventilates the air in a building by circulating warm, dry, fresh air.

This assists greatly with cutting out water vapour and odours in a home so helping create a healthier living space as well as a more comfortable one on a day to day basis.

SolarVenti is clean and environmentally friendly and because it

traps solar energy, there is no need for electrical connections which of course, means no on going running costs.

It draws air through means of a solar powered fan through its back and then across a mat before discharging it as heated air into the house.

Some large units have a thermostat to control inside temperatures and each collector has an on/off switch so can be stopped when the sun is too hot.

While the SolarVenti

does not take the place of a conventional heater, it does take the edge of the coolness of a home and gives it a gentle warmth.

SolarVenti comes in sizes ranging from 720 x 540 mm to 3000 x 1020 and it is only 100 mm in depth. The largest of the units weighs just under 30 kilograms. It does not need external power or plumbing and so is easy to install.

Inquiries about SolarVenti units can be made the Global Export Solutions on 9830 2161.
